

Main building ID sign consists of custom fabricated reverse channel letters on cabinet (red LED halo lit).

SOUTHWEST TRANSIT EXTERIOR SIGN PROJECT

The SouthWest Metro Transit project involved a variety of different types of illuminated and non-illuminated exterior building identification applications, as well as fleet graphics for all of their new buses. Such a wide variety of sign and graphic applications would put this project out of reach of most single sign companies.

Illuminated applications include spot lit wall mounted dimensional letters and red LED halo lit custom fabricated reverse channel letters. Both of these applications provide excellent visibility during the day or night. Other illuminated applications included designing and fabricating an internally lit 48" diameter roman numeral clock.
